

Quarterly Platform Report

Platform Health and Roadmap Summary

Pinpoint Engineering

March 2026

Contents

1	Executive Summary	2
2	Platform Metrics	2
2.1	Reliability	2
2.2	Performance	2
3	Architecture Updates	3
3.1	Diagram: Dispatch Flow	3
4	Looking Ahead	3

1 Executive Summary

This quarter saw significant progress across the platform. Test execution throughput increased by 34% following the migration to parallel dispatchers, while the average bug report resolution time decreased from 48 hours to under 18.

Key Insight

The combination of API token expansion and MCP server integration has reduced onboarding time for new enterprise clients by roughly half compared to the previous quarter.

2 Platform Metrics

2.1 Reliability

System uptime remained at 99.97% across all production regions. The single incident on February 12 was traced to a certificate rotation failure in the staging proxy, which did not affect customer-facing services.

Table 1: Availability by Region

Region	Uptime	Incidents
US East	99.99%	0
EU West	99.97%	1
APAC	99.98%	0

2.2 Performance

Critical Point

Peak API response time exceeded the 200ms SLA target on three occasions during batch import windows. The dispatcher queue redesign in v2.4 addresses this with priority-based routing.

3 Architecture Updates

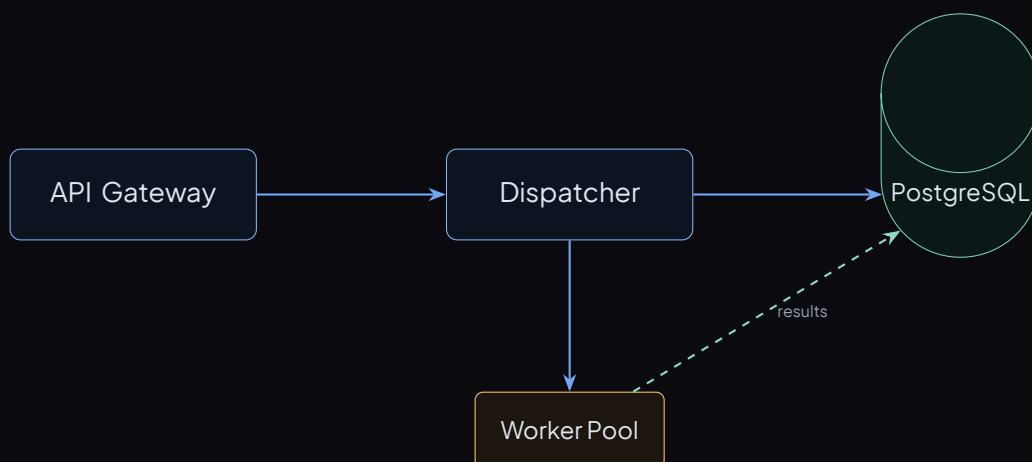

The platform architecture shifted toward a more modular dispatch layer this quarter. The key changes are summarized below.

- Migrated from monolithic dispatcher to per-project worker pools
- Introduced API token scoping for CLI and MCP integrations
- Added tenant-aware caching at the service boundary

Technical Detail

Worker pools use a weighted fair-queuing algorithm that allocates capacity proportional to each tenant's contracted tier. Enterprise tenants receive dedicated pool reservations, while Professional and Core tenants share a common pool with burst capacity.

4 Looking Ahead

Q2 priorities focus on three areas:

1. **Onboarding automation** through project templates and guided setup flows
2. **Reporting engine** for scheduled bug report digests per project
3. **CLI feature parity** with the web dashboard for power users

Business Value

Automated onboarding is projected to reduce the average time-to-first-test from 3 days to under 4 hours, directly improving trial-to-paid conversion rates.

The best testing platform is the one your team actually uses every day.

Warning

The legacy webhook format will be deprecated in v2.5. All integrations must migrate to the v2 event schema before June 30, 2026.
